App Development Training with Swift

We are excited to offer three Apple Authorized training courses that help students master native app development using Swift. In the 2-day Introduction to Swift, students learn the foundations of the Swift programming language, including: syntax, logic, structures, and functions. The 3-day Introduction to the iOS SDK teaches students how to build and run Swift-based apps for both iPhone and iPad through hands-on activities and coding exercises. For a comprehensive learning experience, select the 5-day App Development with Swift course, which covers all content from the previous two courses.
